

R-squared (R²) • R-squared is a statistical measure of how close the data are to the fitted regression line • It is the percentage of the response variable variation that is explained by a linear model. Or: R-squared = Explained variation / Total variation • R-squared is always between 0 and 100% • 0% indicates that the model explains none of the variability of the response data around its mean • 100% indicates that the model explains all the variability of the response data around its mean • The higher the R-squared, the better the model fits your data

```
Simple linear regression

# Split the data into training/testing sets
diabetes_X_train = diabetes_X[:-20]
diabetes_X_test = diabetes_X[-20:]

# Split the targets into training/testing sets
diabetes_y_train = diabetes.target[:-20]
diabetes_y_test = diabetes.target[-20:]
```

```
# Create linear regression object
regr = linear_model.LinearRegression()

# Train the model using the training sets
regr.fit(diabetes_X_train, diabetes_y_train)

# Make predictions using the testing set
diabetes_y_pred = regr.predict(diabetes_X_test)

# R-squared score: 1 is perfect prediction
print('R-squared: %.2f' % r2_score(diabetes_y_test, diabetes_y_pred))
R-squared: 0.47

Copy and paste the assignment into a new Anaconda window The code is available at: https://github.com/pinelle The code runs polynomial regression on a randomly selected dataset The data is plotted on a scatterplot, and the regression line is shown Continue to run the code approximately 20 times, and note how the data distribution affects the R-squared value

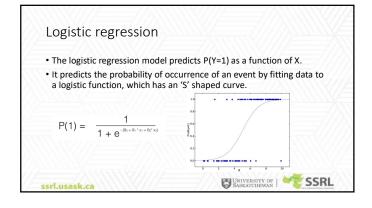

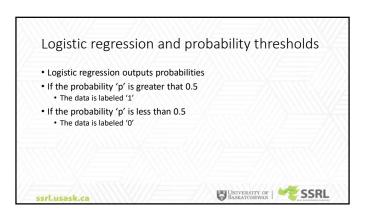

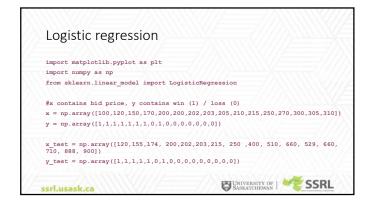

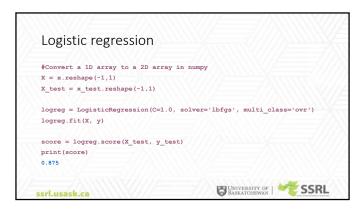

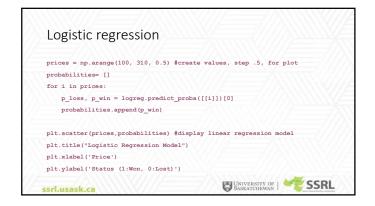

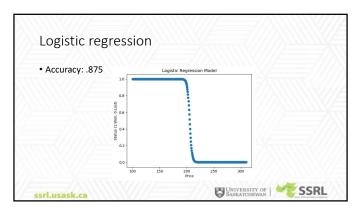

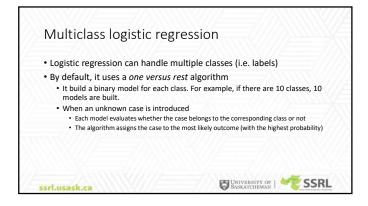

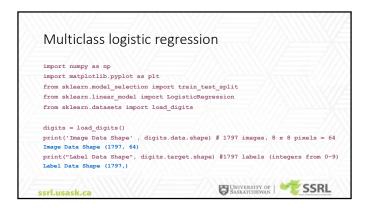

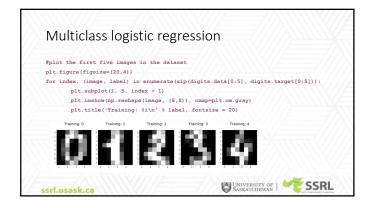

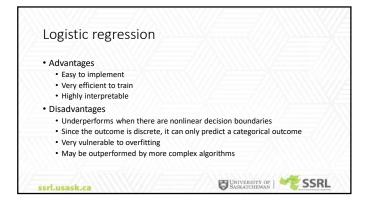

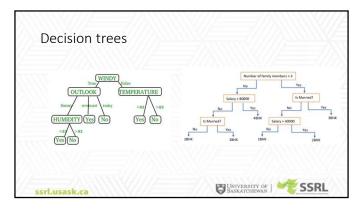

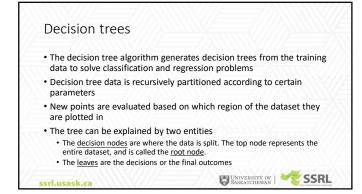

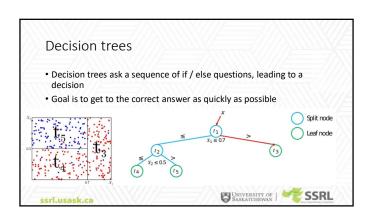

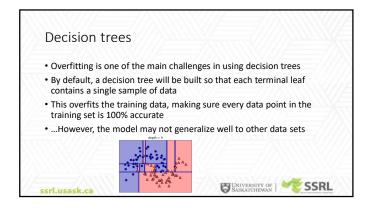

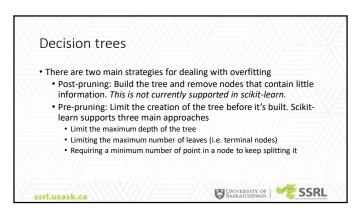

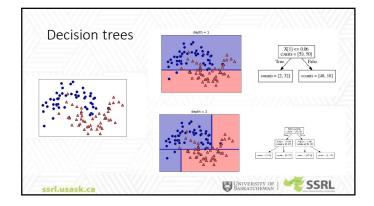

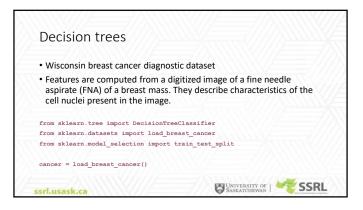

```
#569 instances, 30 features

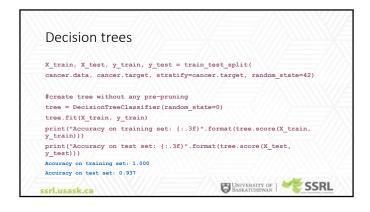

print("Target names:", cancer['target_names'])

Target names: ("malignant' 'benign')

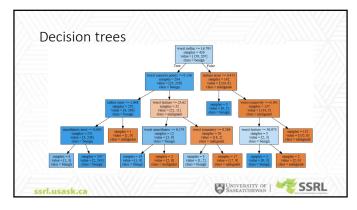

print("Feature names: \n", cancer['feature_names'])

Feature names:
['mean radius' 'mean texture' 'mean perimeter' 'mean area'
'mean smoothness' 'mean compactness' 'mean concavity'
'mean concave points' 'mean symmetry' 'mean fractal dimension'
'radius error' 'compactness error' 'concavit dimension'
'smoothness error' 'compactness error' 'area error'
'concave points error' 'symmetry error' 'fractal dimension error'
'worst radius' 'worst texture' 'worst perimeter' 'worst area'
'worst smoothness' 'worst compactness' 'worst concavity'
'worst concave points' 'worst symmetry' 'worst fractal dimension']

Need to decide how many trees to build (the n_estimators parameter in Scikit-learn) For each tree in the forest, take a bootstrap sample of the data. From n_samples data points, repeatedly draw randomly with replacement, n_samples times This will create a dataset that is as big as the original dataset, but some data points will be missing (approx. 1/3), and some will be repeated

• "TensorFlow: With the initial release of this open source machine learning framework being 2015, it has been deployed across many different platforms and is easy to use. Created by Google at first, now all the top tech giants such as eBay, Dropbox, Intel and Uber use it extensively. With the help of flowgraphs, one can develop neural networks." • "Microsoft Cognitive Toolkit: Initially released about three years back, this is an Al solution that you can use to take your machine learning projects to the next level in every way. Certain studies have revealed that the open source framework can train certain algorithms to function like the human brain." https://www.analyticsinsight.net/the-6-most-important-ai-technologies-in-machine-learning/
